### TRANSITION TO ECOLOGICAL PACKAGING

Political initiatives concerning climate protection and the „Fridays for Future“ movement have shown a need for change on all levels.

In cooperation with the powerful environmental service provider INTERSEROH, we are making a contribution to an intelligent recycling economy and are thus significantly reducing resource consumption and greenhouse emissions.

We are now going one step further and are introducing new packaging material with an improved environmental footprint which, however, meets the same quality demands with regards to function. The labeling and list of contents will remain unchanged on the new brown cardboard boxes. Therefore, no process change will be required on your part.

Due to logistical reasons, the transition will, however, require some time so that the parallel use of the old white boxes and the new brown packaging materials will be unavoidable.

The new packaging material has been kept plain brown in colour. It is not bleached during the manufacturing process, so no chemicals are used which could be harmful to the environment.

The energy needed for production and hence the CO<sub>2</sub> generated is considerably less than with the previous material, which allows us to decrease our use of resources and actively contribute to a better environment.

Switching to environmentally friendly packaging material and climate-neutral paper and printing supplies makes a lasting impact on our ecological footprint.

Striving together for a better future.
